

This chart shows the average sizes (in μm) of various particles in comparison to the filtration performance of the membranes used.

The Y-axis is logarithmically scaled to better illustrate the large differences.

All potentially dissolved impurities, contaminants, and microbiological pathogens present in tap water are significantly larger in diameter than the finest pores of the filter membranes used in the AQUANTIS UrQuelle®Diamant system — and are therefore reliably and completely retained. This is achieved through a purely physical process that works entirely without chemicals or aggressive UV radiation, taking its inspiration from nature itself.

Thanks to its outstanding filtration performance, the AQUANTIS UrQuelle®Diamant system delivers not only delicious, premium-quality water but also hygienically flawless water — just like pure mountain spring water, right from your tap.
